

# Typescript - Access modifiers

- Aditya Kumar  
Chief Technology Officer, [edwisor.com](https://edwisor.com)

# We will cover with the following concepts

- 1) Public
- 2) Private
- 3) Protected
- 4) Getters and Setters (properties)

# Access modifiers control what is to be shown to the outside world

- **Public** - Its accessible from outside the class
- **Private** - It's accessible only inside the class. Not accessible to any object instance of the class.
- **Protected** - It acts like private but the only difference is, its is accessible to the derived classes as well. We will learn more about it in Inheritance.

# To set and get the values of private fields, we use accessors

Let's take an example of how to create getters and setters

# The next steps are ...

Extending the classes
